

HR / Behavioural Answers — Interview Scripts

Narendra Kumar · Unique answers in simple English · Speak naturally, not like a textbook

1) What is your strength?

Sav this

*My strength is that I don't stop at "it works on my laptop." When I build something, I try to make it usable for real users — auth, fallback, deployment, and edge cases. For example, in **GeoVerse**, if the AI key is missing, the app still works with a local fallback. In **Nyay Sahayak**, I didn't only connect an LLM — I added retrieval so answers stay grounded in law text. Hackathons also trained me to stay calm and ship under time pressure.*

Extra strength options

- Attention to detail → from photography + debugging
- Ownership → I take a feature from idea to deploy
- Learning speed → AWS cert + RAG stack learned by building

2) What is your weakness?

Avoid: "I am a perfectionist" / "I work too hard"

Sav this

Earlier, I used to understand topics only at the surface — I could explain the idea, but I struggled when interviewers went one level deeper. I saw this clearly in my mock interview feedback: "good understanding, needs more depth." So now I changed my method. For DSA, I don't just solve — I explain time/space and edge cases out loud. For projects, I prepare follow-up questions like tradeoffs and failure cases. I'm still improving, but my answers are more solid than before.

3) Why should we hire you?

Sav this

You should hire me if you want someone who can learn fast and also deliver working software. I already have proof: a live RAG product, a multi-API React app, and an AWS serverless pipeline — plus an AWS Cloud Practitioner cert. I'm not coming only with theory. I'm coming with shipped projects, hackathon experience, and the hunger to go deeper every day. If you give me a chance, I'll take ownership of tasks, ask clear questions, and improve quickly with feedback.

Short version (30 sec)

I build and ship. I have live projects, cloud fundamentals, and strong willingness to go deep. I'll contribute early and grow with the team.

4) Why this company / this role?

I want to work on real users and real systems, not only college demos. Your company's work in _____ interests me because _____. I can contribute with my Python/React/AWS base, and I want to learn production-quality engineering from your team.

5) Where do you see yourself in 3–5 years?

In 3 years, I want to be a reliable engineer who can own a feature end-to-end — backend, quality, and basic design decisions. In 5 years, I want to mentor juniors and help design systems that stay simple, reliable, and measurable. Right now my focus is becoming strong in fundamentals and clean delivery.

6) Tell me about a failure / challenge

Use one project difficulty (Nyay Sahayak RAG grounding / GeoVerse API fallback / AWS pipeline wiring). Then end with: *What I learned is: measure first, then fix. Don't guess in production.*

STAR reminder

Situation → Task → Action (your action) → Result
